Fire detection and security control panels

Caccialanza & C. produces a complete range of fire detection panels and of combined integrated security control panels. Basically following families can be used according to the particular requirements of the application:

FMZ5 multifunctional control panel.

It is the most advanced solution for any application in the fire detection and security field. Is a distributed architecture microprocessor controlled modular system, which makes it possible the use of several different type at field connections both for input and for output devices. The system is intended from medium to large and very large installation.

FMZ4 Fire control panel

It is the microcontroller operated solution for small panels with standard detection and fire extinghuishing functions. Represents in this segment a very affordable solution with good reliability and high technical standard.

FMZ3 Control panel

It utilizes analog technology and a modular design which makes it possible to extend the primary use for fire detection and extinghuishing commands also to several security applications. The system is intend for utilization in small to large installations and is accordingly offering a wide range of panel sizes and executions.
